PROBLEM TO BE SOLVED: To provide a container excellent in heat resistance, processability and transparency. **SOLUTION:** This heat-resistant container is made from a transparent polyester/polycarbonate composition obtained by actively transesterifying a polycarbonate with a polyester in a molten state. This container is desirably the one obtained from a composition having a single glass transition point and a single-phase morphology. It is more desirably the one made from a transparent polyester/polycarbonate composition which is inhibited from being crystallized and is kept transparent even when heat-treated at near the glass transition temperature or above.
